

Developing robots we can use and continue to be able to use

Faced with the societal problem of deterioration over time, iXs began first by developing inspection robots to help preserve our social and industrial infrastructure. We now work to propose and develop new robots that can be used—and which will remain usable—for practical use on site. In order to achieve this goal, we propose the most optimum solutions not just from the standpoint of robot development, but from a perspective that considers the entirety of the customer's business flow. We then offer them one-stop service every step of the way until they can make real, practical use of our robots.
